

# SEC-202: Secure Start-Up

## Lecture 2 – Identity and Endpoint Security

Instructed By:

**Dr. Charnon Pattiyanon**

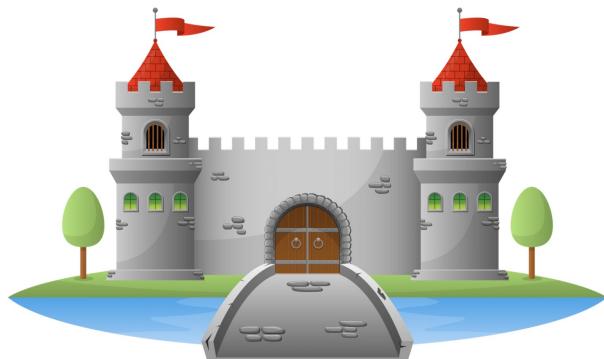

Assistant Director of IT and Instructor  
**CMKL University**

Artificial Intelligence and Computer  
Engineering (AICE) Program

# Class Agenda

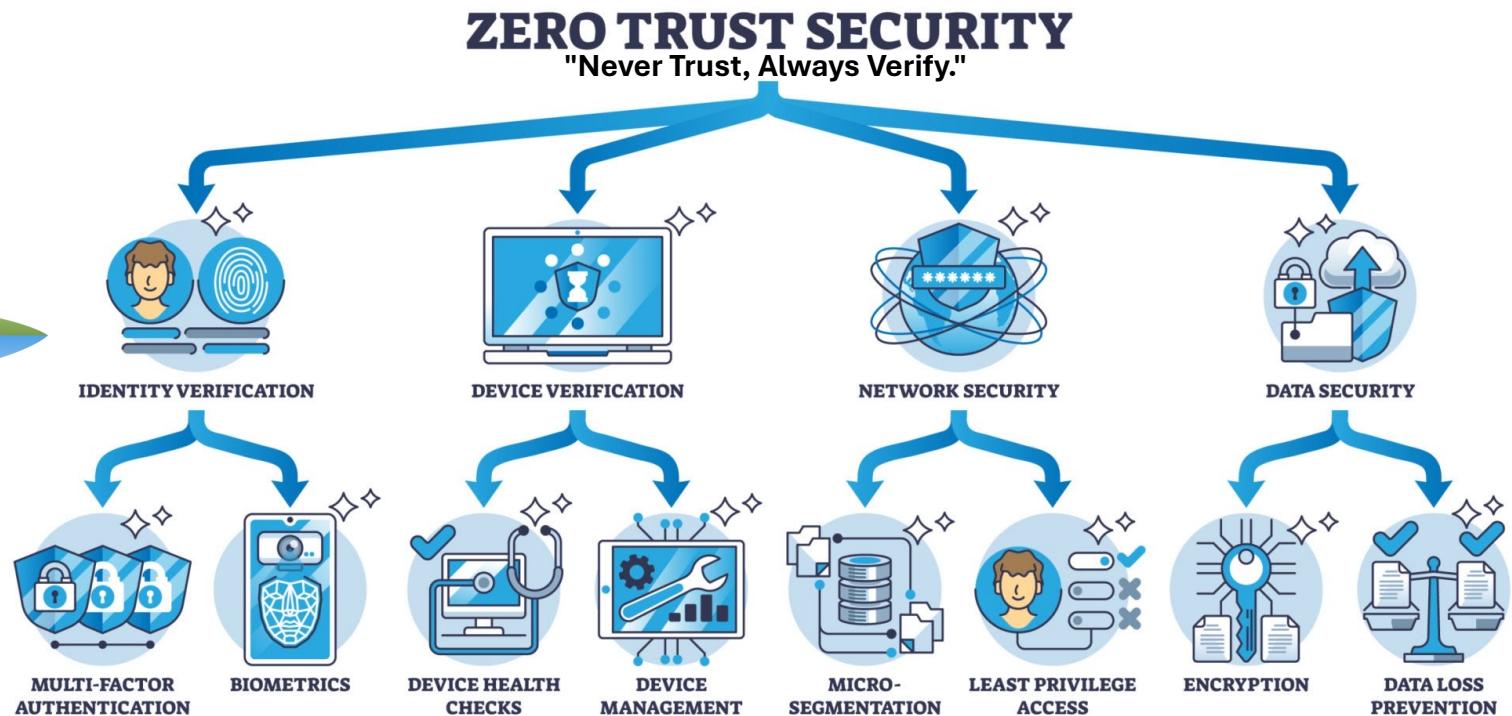

- Identity is the New Perimeter (Zero Trust)
- Identity and Access Management Core Concepts
- The Password Problem
- Multi-Factor Authentication (MFA) Deep Dive
- Single Sign-On (SSO)
- The Principle of Least Privilege (PoLP)
- Endpoint Protection – EDR vs. Legacy Anti-Virus
- Mobile Device Management (MDM) and Browser Security
- Secrets Management and Offboarding

# Identity is the New Perimeter (Zero Trust)

## The "Castle & Moat" is Dead:

- Traditional security relied on a **firewall** (the moat) to protect the **office** (the castle).
- **Problem:** If an attacker gets inside the castle (phishing), they can move freely. Also, users are now working from **coffee shops** and **homes**, outside the castle walls.

We don't trust you just because you are on the office Wi-Fi. We verify every request based on:

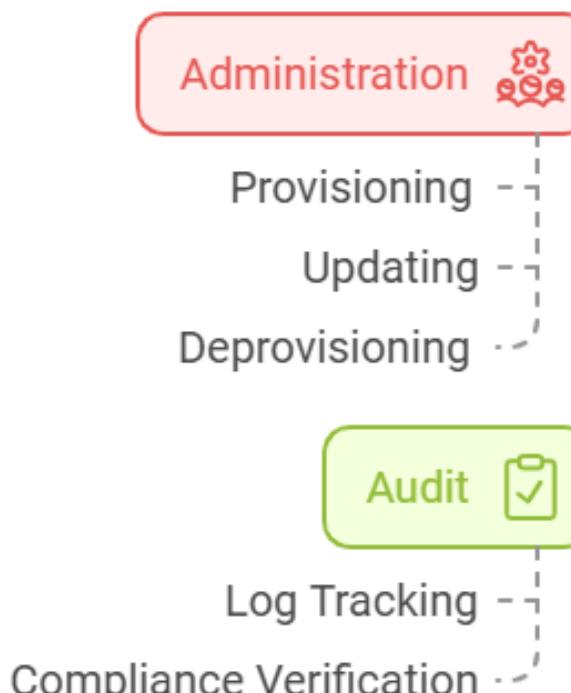

**Identity:** Who are you?

**Device Health:** Is your laptop patched?

**Context:** Are you logging in from an unusual location?

# Identity and Access Management – Core Concepts

**Identification:** The user claims an identity (e.g., typing `user@company.com`).

**Accounting:** The system logs the activity for future audits.

**Authentication (AuthN):** The user proves they are who they say they are (e.g., Password, FaceID).

**Authorization (AuthZ):** The system decides what the user is allowed to do (e.g., Read-Only access vs. Admin access).

# Identification & Authentication

# The Password Problem

## ■ Why Humans Fail:

- We crave convenience. We choose "Password123" or "Summer2024!".
- **Reuse:** We use the same password for Netflix and our Bank.

## ■ Credential Stuffing:

- Attackers take a leaked database from a low-security site (e.g., a fitness forum) and try those same email/ password combos on high-value targets (e.g., Corporate Email).

## ■ Modern Password Policy (NIST Guidelines):

- **Do:** Use long passphrases (e.g., *Correct-Horse-Battery-Staple*).
- **Don't:** Force rotation every 90 days (it makes people choose weaker passwords).
- **Don't:** Rely on complexity rules (e.g., Pa\$\$w0rd is easy to guess but "complex").

# Multi-Factor Authentication (MFA) Deep Dive

**Something You Know**  
(Password, PIN, ...)

**Something You Have**  
(Keys, Badges, Tokens, Cards, ...)

**Something You Are**  
(Biometric, Retina Patterns, ...)

**Something You Do**  
(Handwriting, ...)

**Where You Are**

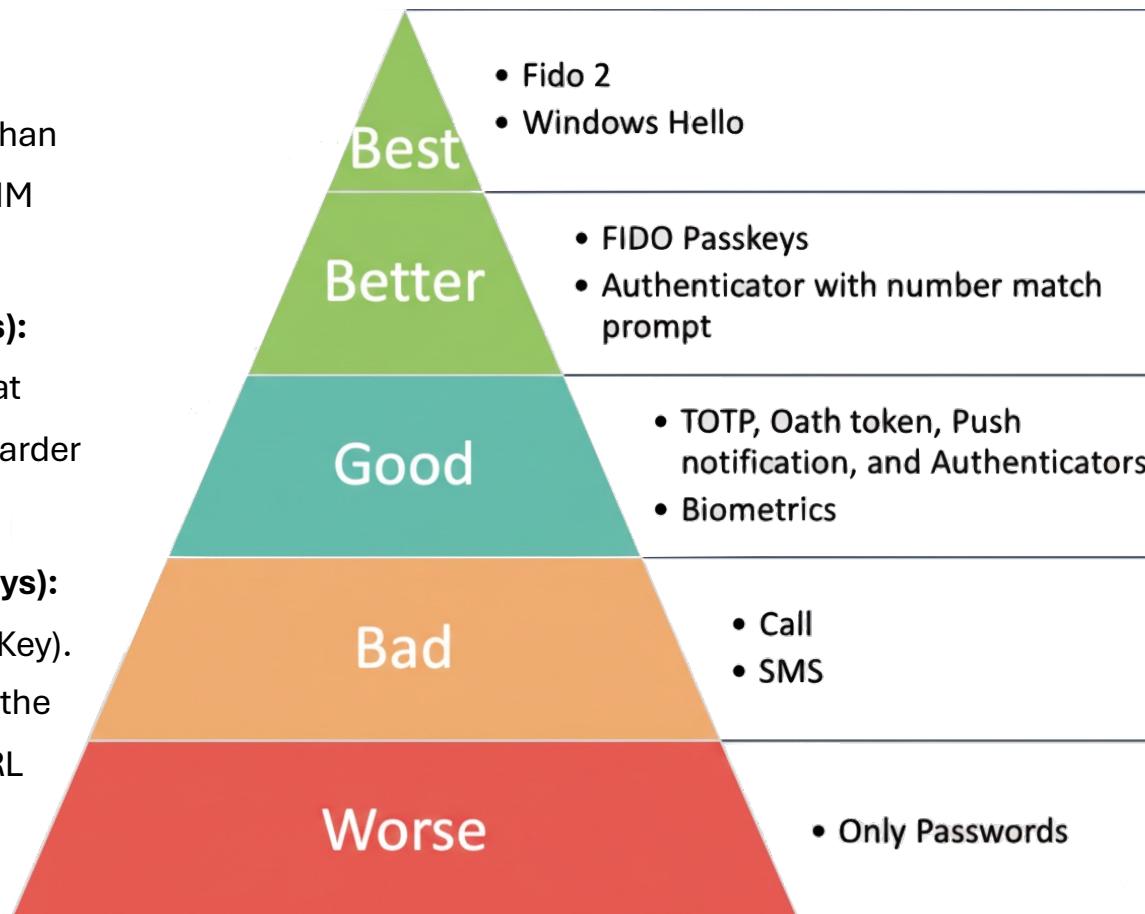

## Where you are?

- does not verify identity, ***unless only one person can enter that location.***
- could **reduce** the number of possible identities.
- but should rather be thought of as **access restriction**, than an authentication mechanism

# Multi-Factor Authentication (MFA) Deep Dive

## ▪ MFA Hierarchy of Safety:

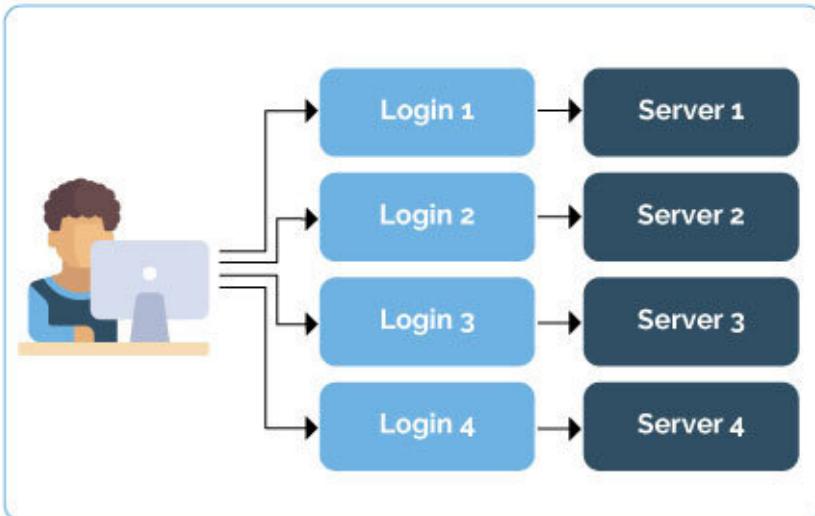

- **Good (SMS/Email):** Better than nothing, but vulnerable to SIM Swapping and interception.
- **Better (Authenticator Apps):** Generates a code (TOTP) that rotates every 30 seconds. Harder to hack.
- **Best (FIDO2 / Hardware Keys):** Physical USB keys (like YubiKey). Phishing-resistant because the key verifies the website's URL before unlocking.

# Single Sign-On (SSO)

**The Concept of SSO:** One "Master Key" (Identity Provider) unlocks all doors (SaaS Apps).

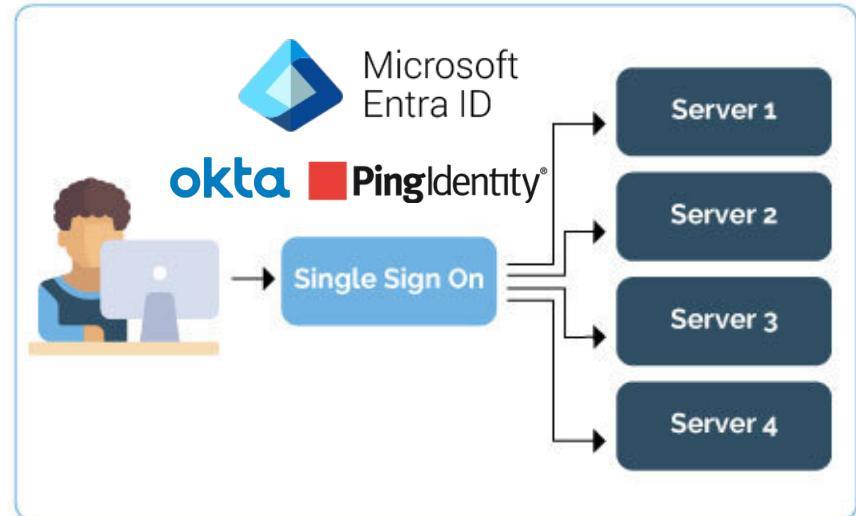

## Without Single Sign On (SSO)

### ▪ Benefits:

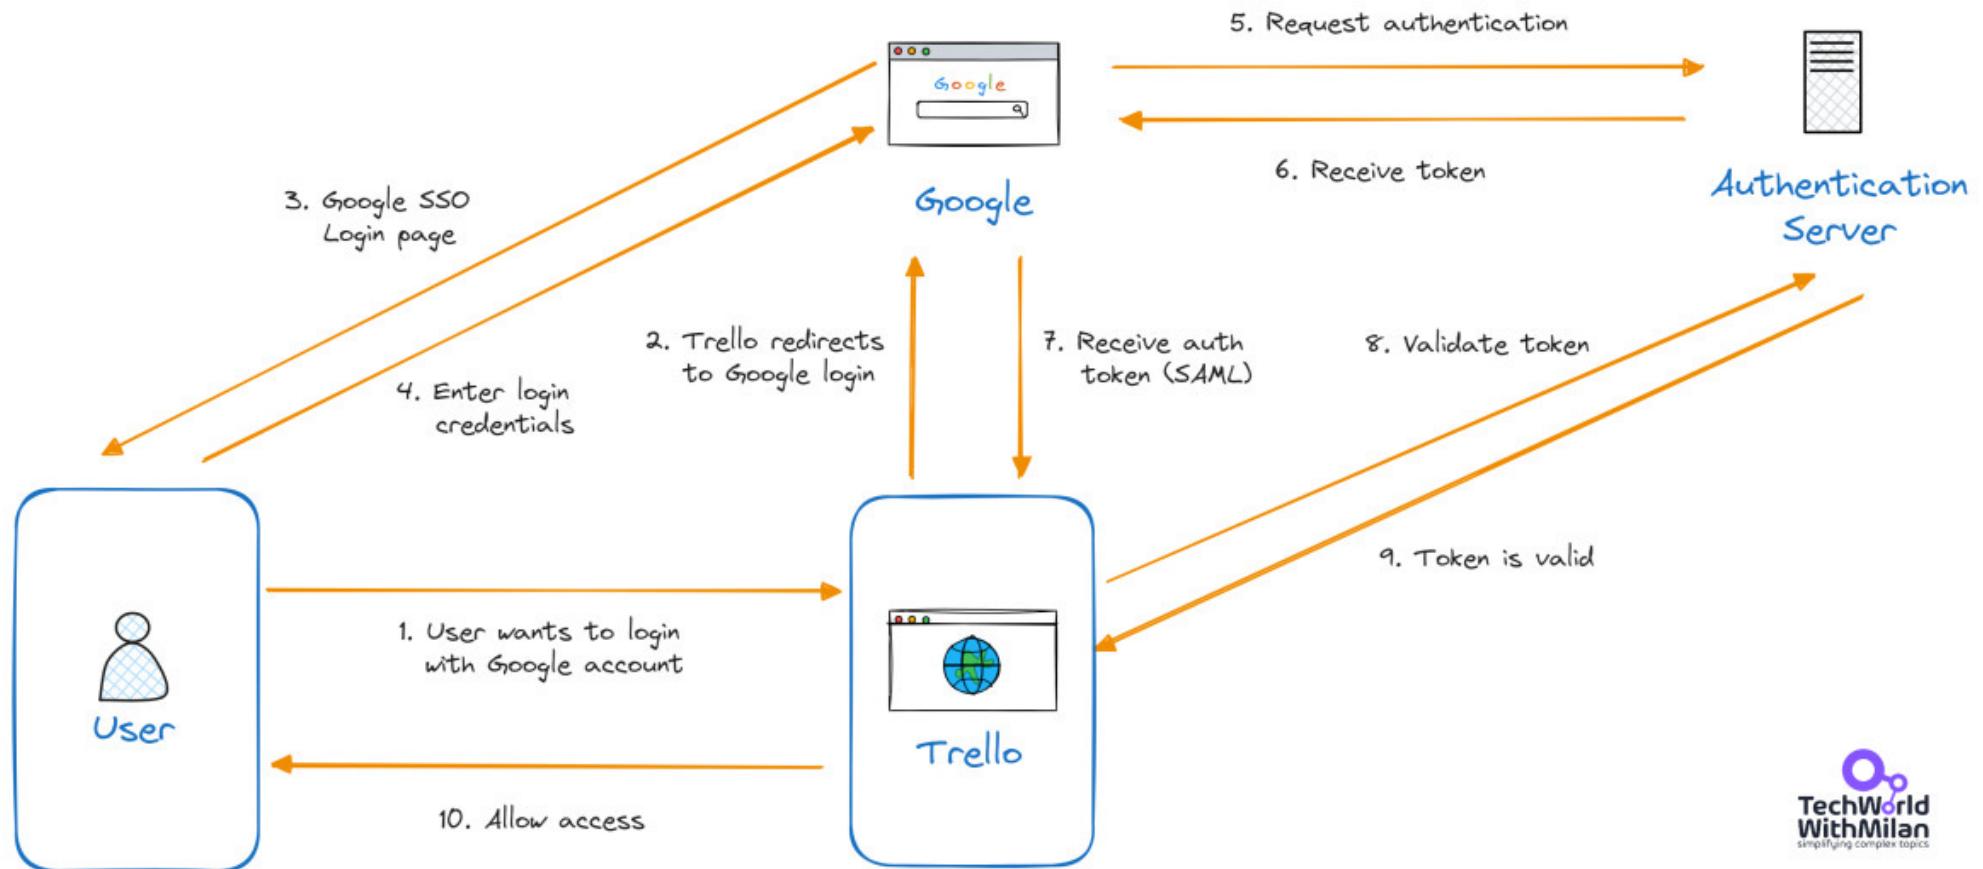

- **User Experience:** Log in once, access everything.
- **Security:** IT has a single "Kill Switch." If an employee leaves, disabling their Okta account instantly locks them out of Slack, Salesforce, Zoom, and Email.

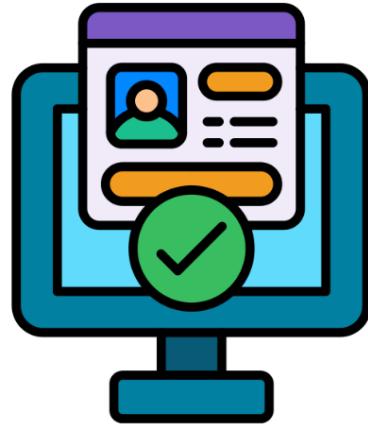

## With SSO

- **Risks:** It is a Single Point of Failure. If the SSO admin account is breached, the attacker owns the company.

# Single Sign-On (SSO) – How Does It Work?

# Authorization & Access Control

# The Principle of Least Privilege (PoLP)

- **Definition:** A user, program, or process should have only the bare minimum privileges necessary to perform its function.
- **Standard vs. Admin:**
  - Day-to-day work (email, browsing) should never be done as a Local Administrator.
  - Why? If you click a malicious link as an Admin, the malware gets Admin rights too.
- **Just-In-Time (JIT) Access:**
  - Instead of giving someone "Permanent Admin" rights, give them "[Admin for 2 hours](#)" to fix a specific issue, then automatically revoke it.

**5 benefits of using principle of least privilege**

- 1 Prevents the spread of malware
- 2 Decreases chances of a cyber attack
- 3 Improves user productivity
- 4 Helps demonstrate compliance
- 5 Helps with data classification

# Access Control

- Access control is the heart of security.

- **Definitions:**

- The **ability to allow** only authorized users, programs, or processes to access resources.
  - The **granting or denying**, according to a particular security model, of certain permissions to access a resource.
  - An entire set of procedures performed by hardware, software, and administrators, to **monitor access**, **identify users requesting access**, **record access attempts**, and **grant or deny access** based on pre-established rules.

# Access Control Tools and Methods

## ▪ Access Control Matrix

- An access control matrix is a matrix ( $M_{S,O}$ ) whose rows are subjects and columns are objects.
- An element  $m_{s_i,o_j} \in M_{S,O} \subseteq P$  is the set of permissions that a subject  $s_i \in S$  is authorized to access an object  $o_j \in O$ .
- **Disadvantages:** In a large system, the matrix will be enormous in size and mostly sparse.

	$O_1$	$O_2$	$O_3$	$O_4$	$O_5$	$O_6$
$S_1$	Y	Y	Y	Y	Y	N
$S_2$	N	N	Y	N	Y	N
$S_3$	N	N	N	N	N	Y

# Access Control Tools and Methods

## ▪ Access Control Matrix

- An access control matrix is a matrix ( $M_{S,O}$ ) whose rows are subjects and columns are objects.

- **Let's try this together:**

- Suppose the private key file for  $S_1$  is object  $O_1$ ,  
i.e., only  $S_1$  can read,
  - Suppose the public key file for  $S_1$  is object  $O_2$ ,  
i.e., all subjects can read, and only  $S_1$  can write.
  - Suppose all subjects can read and write object  $O_3$ .
- **What is the access control matrix?**

	$O_1$	$O_2$	$O_3$
$S_1$	?	?	?
$S_2$	?	?	?
$S_3$	?	?	?

# Access Control Tools and Methods

## ▪ Access Control Matrix

- An access control matrix is a matrix ( $M_{S,O}$ ) whose rows are subjects and columns are objects.

- **Let's try this together:**

- Suppose the private key file for  $S_1$  is object  $O_1$ ,  
i.e., only  $S_1$  can read,
  - Suppose the public key file for  $S_1$  is object  $O_2$ ,  
i.e., all subjects can read, and only  $S_1$  can write.
  - Suppose all subjects can read and write object  $O_3$ .
- **What is the access control matrix?**

	$O_1$	$O_2$	$O_3$
$S_1$	R	RW	RW
$S_2$	-	R	RW
$S_3$	-	R	RW

# Access Control Tools and Methods

## ▪ Access Control Matrix:

- **Secrecy:** Does this protection state ensure secrecy of  $S_1$ 's private key in  $O_1$ ?
- **Integrity:** Does this access control matrix ensure the integrity of  $S_1$ 's public key in  $O_2$ ?
- **Trust Processes:** Does it matter if we don't trust some of  $S_1$ 's processes?
- Non-malicious process should not leak the private key by writing it to  $O_3$ .
- A potentially malicious process may contain a **Trojan horse** that can write the private key to  $O_3$ .
- **Least Privilege** – Limit permissions to those required only.
- For instance, restrict privilege of the subject  $S_1$  to prevent leaks.

	$O_1$	$O_2$	$O_3$
$S_1$	R	RW	RW
$S_2$	-	R	RW
$S_3$	-	R	RW
	$O_1$	$O_2$	$O_3$

	$O_1$	$O_2$	$O_3$
$S_1$	R	RW	-
$S_2$	-	R	RW
$S_3$	-	R	RW

# Access Control Tools and Methods

## ■ Access Control List

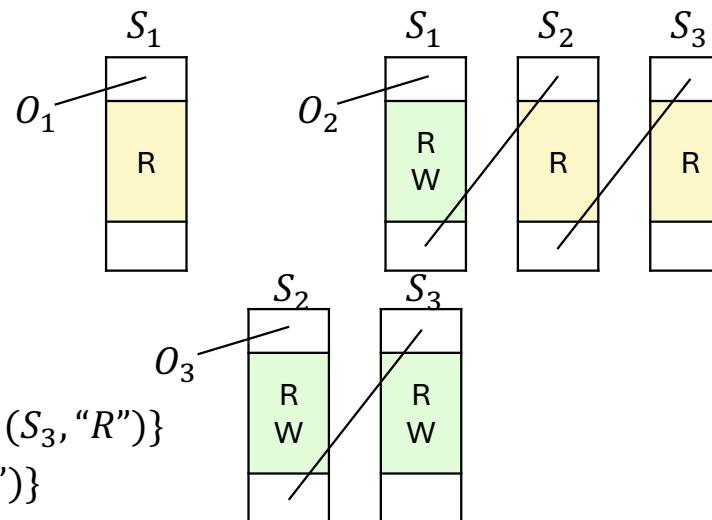

- An access control list is a set  $\{A_o | o \in O\}$ , i.e., one element of **object**. The elements of the list are the pair  $(s, p)$  of **subject**  $s$  who has **permission**  $p$  to that object.

	$O_1$	$O_2$	$O_3$
$S_1$	R	RW	-
$S_2$	-	R	RW
$S_3$	-	R	RW

$$A_{O_1} = \{(S_1, "R")\}$$

$$A_{O_2} = \{(S_1, "RW"), (S_2, "R"), (S_3, "R")\}$$

$$A_{O_3} = \{(S_2, "RW"), (S_3, "RW")\}$$

# Access Control Tools and Methods

## ▪ Capability List

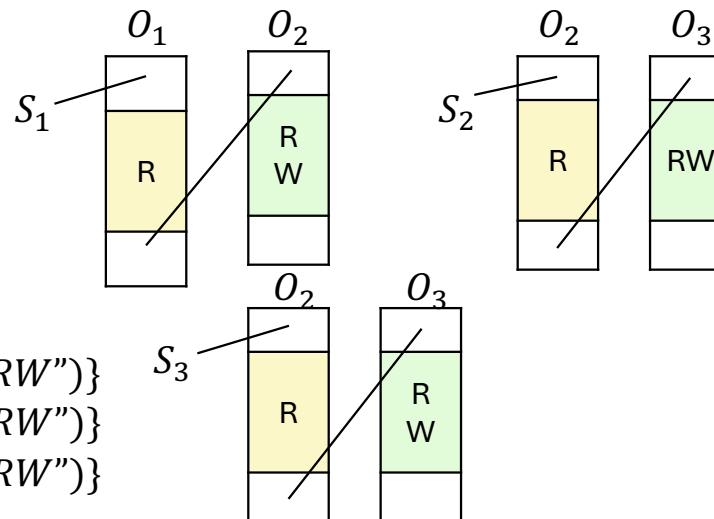

- A capability list is a set  $\{A_s \mid s \in S\}$ , i.e., one element of **subject**. A capability can be thought of as a pair  $(o, p)$  where  $o$  is the name of an **object** and  $p$  is a set of **permissions**.

	$O_1$	$O_2$	$O_3$
$S_1$	R	RW	-
$S_2$	-	R	RW
$S_3$	-	R	RW

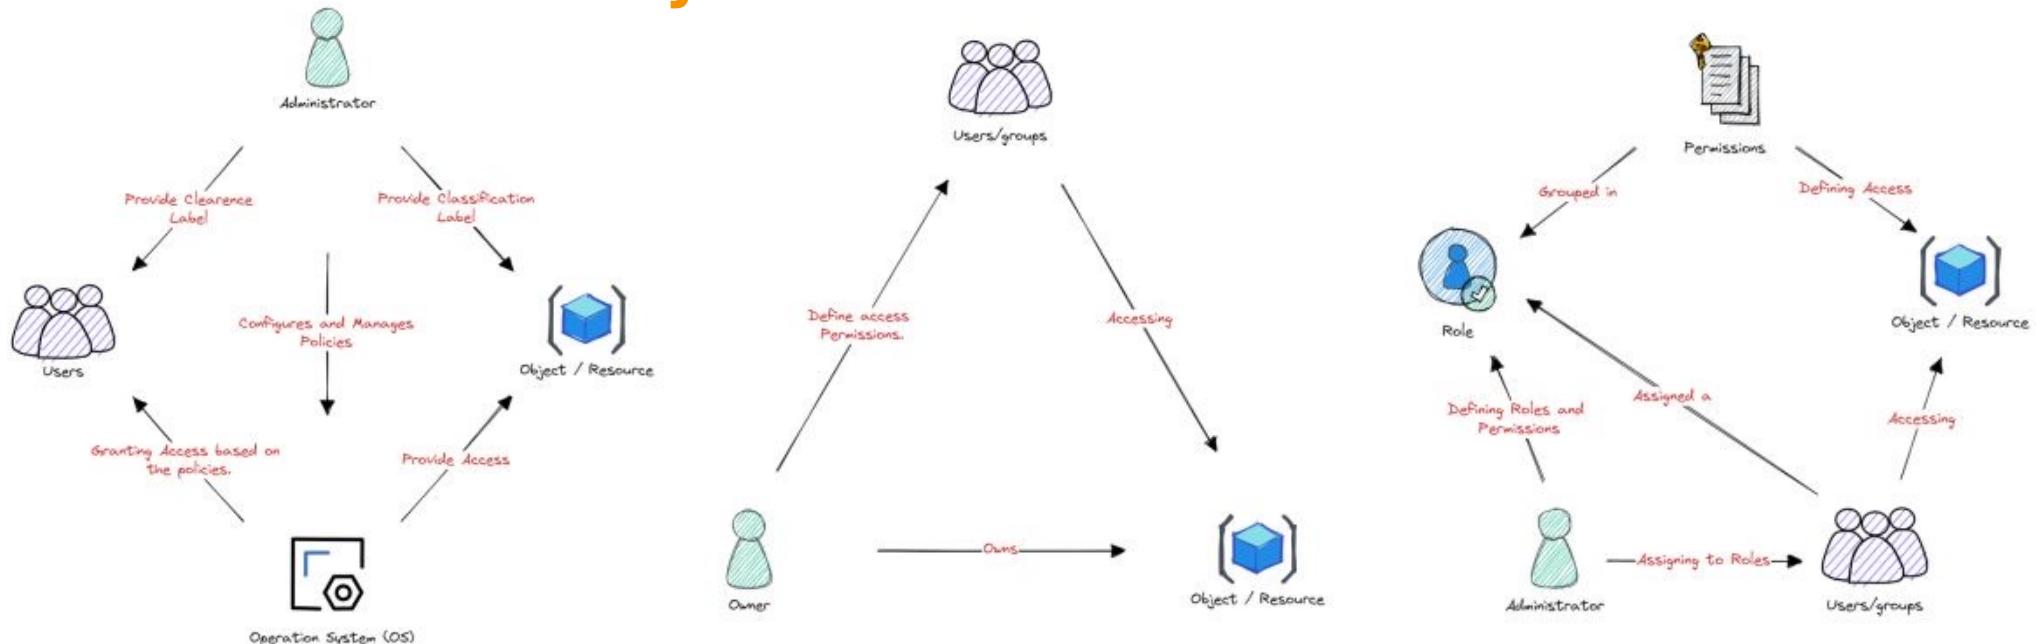

$$A_{S_1} = \{(O_1, "R"), (O_2, "RW")\}$$

$$A_{S_2} = \{(O_2, "R"), (O_3, "RW")\}$$

$$A_{S_3} = \{(O_2, "R"), (O_3, "RW")\}$$

# Access Control Policy Models

## Mandatory Access Control (MAC)

- MAC is a model where access to resources is controlled by the system and is based on predefined security rules.
- MAC has a centralized control structure, with a single entity responsible for setting and enforcing access rules.
- MAC has limited flexibility, as access rules are set by the system and cannot be modified by users.
- MAC typically has a higher overhead, as the system must enforce access rules and ensure they are not violated.

## Discretionary Access Control (DAC)

- DAC is a model where access to resources is controlled by the owner of the resource, who assigns permissions to users.
- DAC has a decentralized control structure, with individual resource owners responsible for setting and enforcing access rules.
- DAC offers more flexibility, as resource owners can assign permissions based on their own discretion.
- DAC has lower overhead, as the burden of setting and enforcing access rules falls on resource owners.

## Role-Based Access Control (RBAC)

- RBAC is a model where access to resources is determined by the role an individual holds within an organization.
- RBAC can have either a centralized or decentralized control structure, depending on the organization's security needs.
- RBAC offers the most flexibility, as access rights can be assigned and modified based on the roles and responsibilities within an organization.
- RBAC overhead depends on the level of centralization, with centralized systems having higher overhead and decentralized systems having lower overhead.

# Endpoint Security

Endpoint Detection & Response, Antivirus, Mobile Device Management,  
Browser Security, Secrets Management, Off-boarding Processes

# Legacy Antivirus vs. Endpoint Detection and Response (EDR)

## ▪ Legacy Antivirus

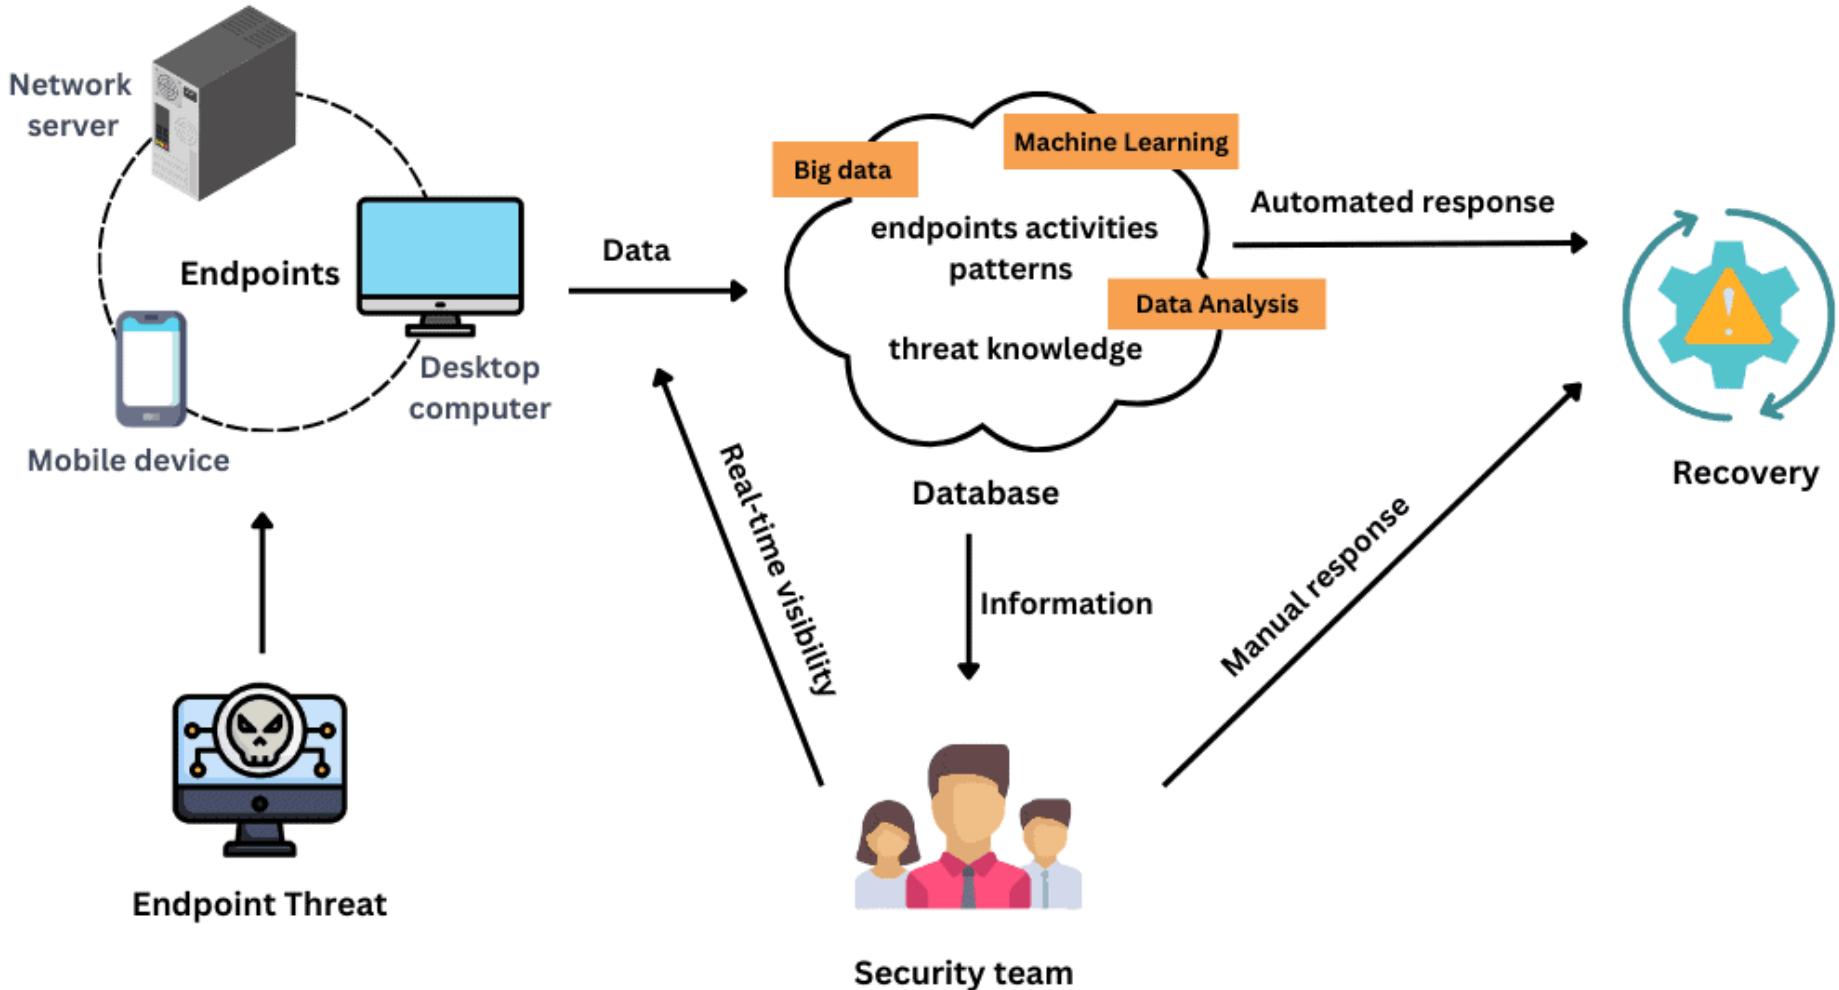

- Works like a "Wanted Poster" (Signatures).
- It scans files against a list of known bad viruses.
- **Fail:** It cannot stop new (zero-day) viruses or attacks that don't use files (fileless malware).

## ▪ Endpoint Detection and Response (EDR)

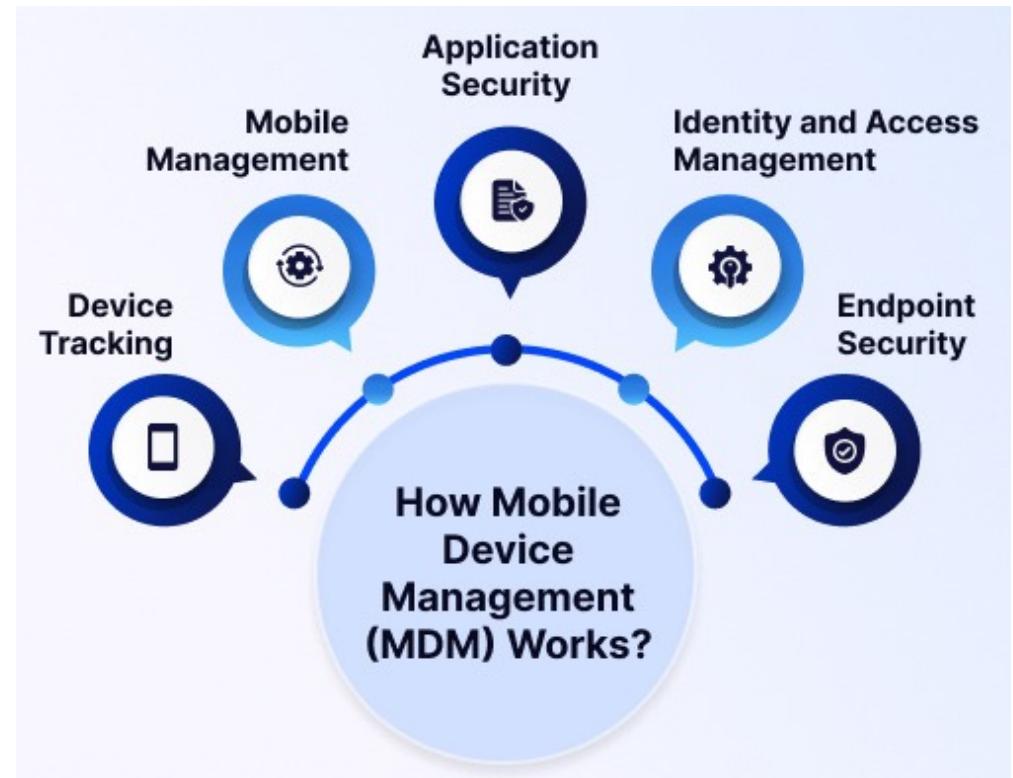

- Works like a "CCTV Camera" (Behavioral).
- It watches what programs do.
- **Example:** If Microsoft Word tries to open PowerShell and download a file, EDR blocks it because that is suspicious behavior, even if the file itself looks clean.

# How Does Endpoint Detection and Response Work?

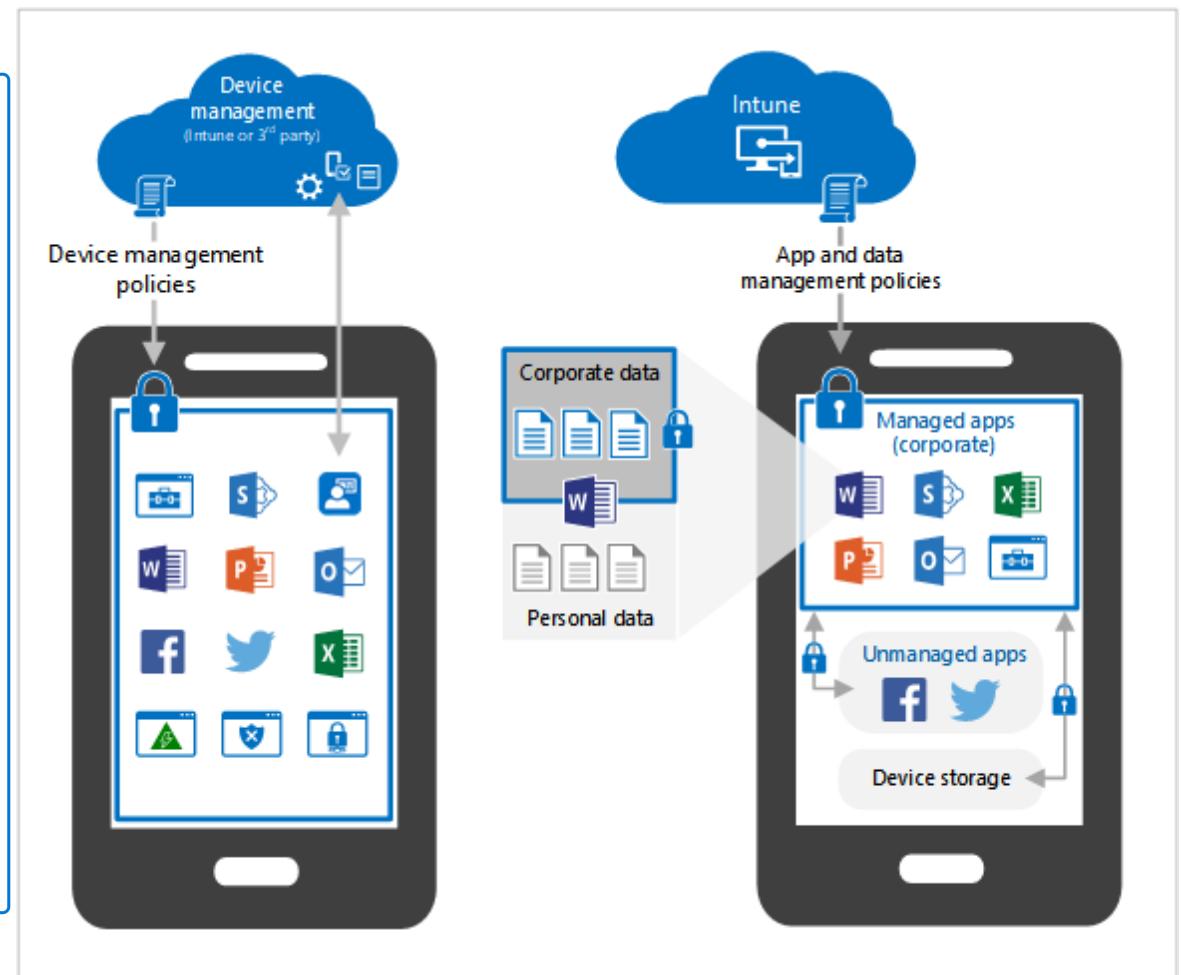

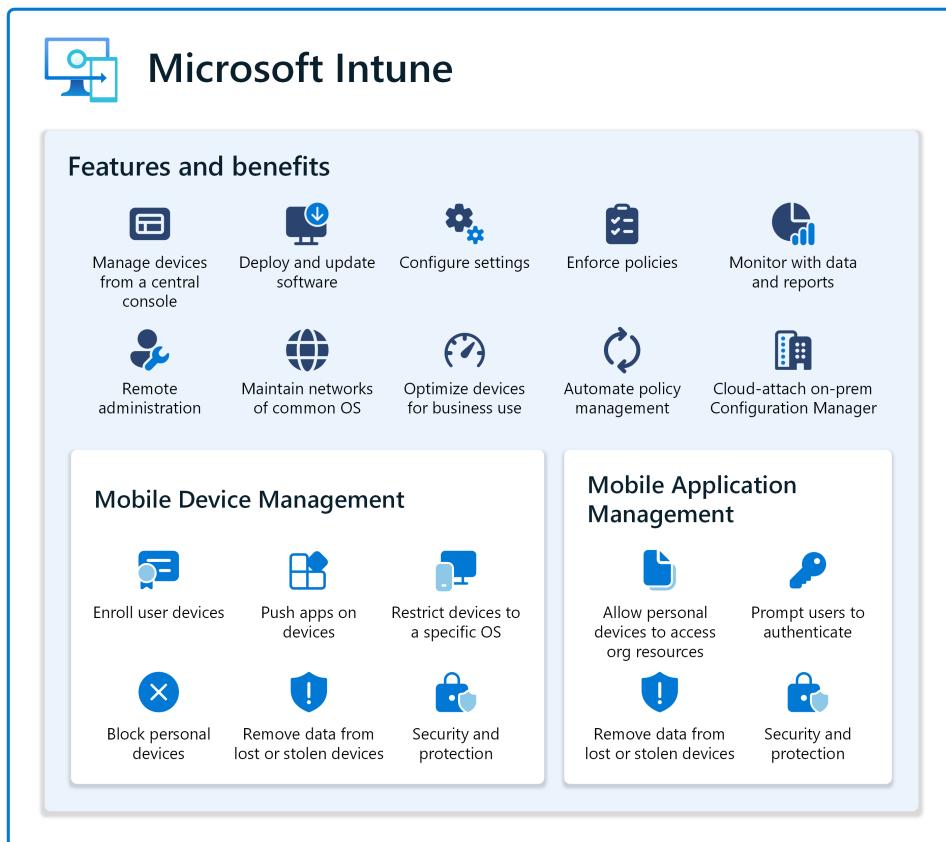

# Mobile Device Management (MDM)

- **The BYOD (Bring Your Own Device) Challenge:**
  - Employees want to use their personal iPhones for work email.
  - **Risk:** What happens if they lose the phone or leave the company?
- **The Solution (MDM):**
  - **Containerization:** Creates a "walled garden" (Work Profile) on the phone. Personal apps (Photos, WhatsApp) cannot touch Work apps (Outlook, Teams).
  - **Remote Wipe:** IT can delete the "Work Profile" without deleting the user's personal photos.

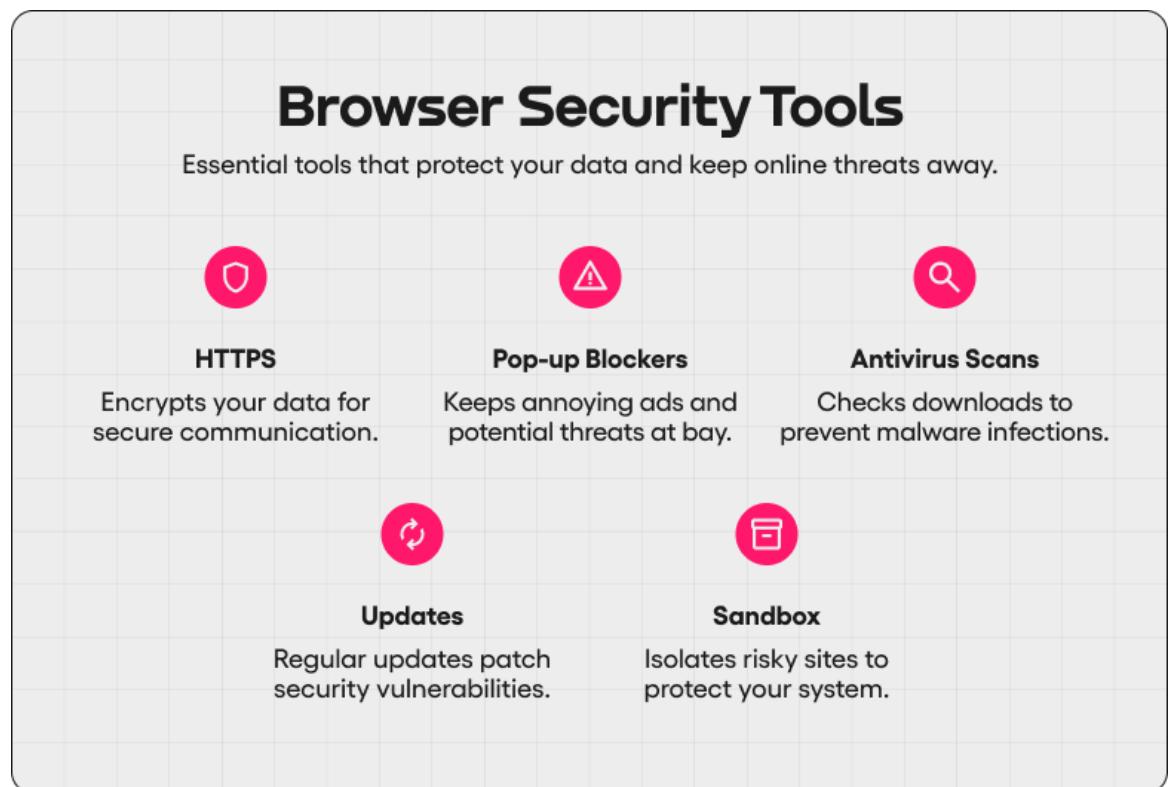

# How Does Mobile Device Management (MDM) Work

# Browsers Security

- **The Browser is the New OS:** Most employees spend **90%** of their day in Chrome or Edge.
- **Attack Vectors:**
  - **Malicious Extensions:** Free PDF converters that secretly read your email.
  - **Drive-by Downloads:** Malware that downloads just by visiting a site.
- **Controls:**
  - Enforcing "Managed Browsers" where IT controls which extensions are allowed.
  - Disabling "Save Password" in the browser (forcing use of a Password Manager).

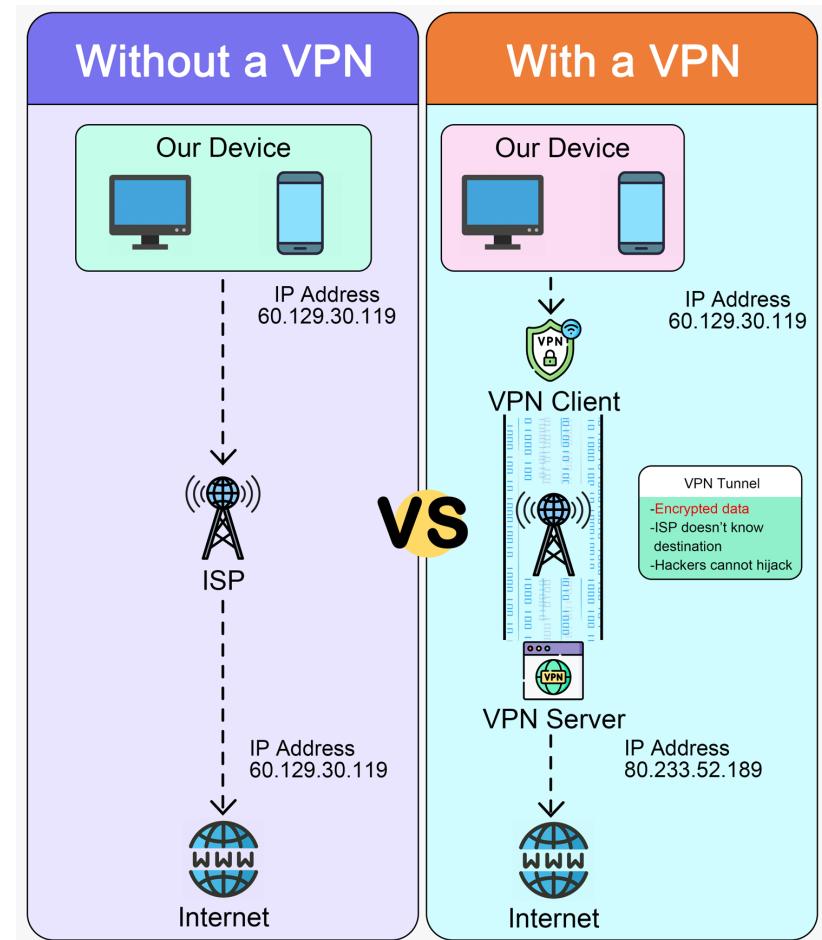

## Browsers Security – How Does It Work?

# 6 Browser Security Best Practices

# Advanced Techniques and Tools for Browsers Security/Privacy

- A **virtual private network**, or **VPN**, is an encrypted connection over the internet from a device to a network. It prevents **unauthorized people from eavesdropping** on traffic and ensures that sensitive personal or professional data is safely transmitted over the internet.
- This can be specifically helpful while accessing websites that **monitor user behavior** or **avoiding targeted ads** based on browsing history.
- Besides, a VPN can protect against cyber threats on **unsecured public Wi-Fi networks**. It masks the user's IP address, **ensuring safer and more private browsing**.

# Advanced Techniques and Tools for Browsers Security/Privacy

- Several websites track user activities through cookies and other data collection techniques.
- **Privacy-focused browser extensions** can limit this tracking and ensure that personal and professional data remain safe.
- Use free-of-cost browser extensions, such as:
  - **Privacy Badger:** Blocks hidden trackers
  - **HTTPS Everywhere:** Ensures secure, encrypted connections
  - **DuckDuckGo Privacy Essentials:** Prevent websites from collecting browsing data
  - **ClearURLs:** Removes tracking elements from links
  - **Cookie AutoDelete:** Automatically clears unnecessary cookies after leaving a website
- Installing and keeping these extensions updated to enhance online privacy and security.

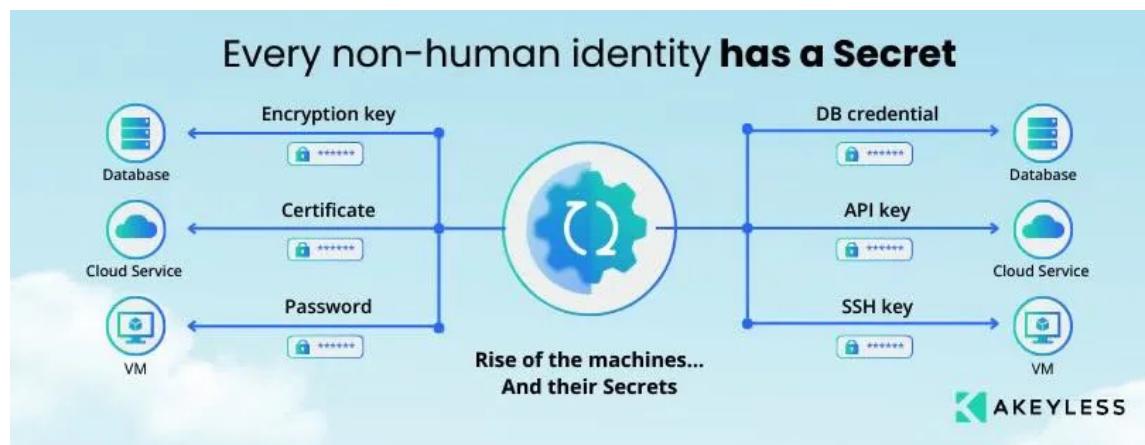

# Secrets Management

## ■ The Hidden Identity Risk:

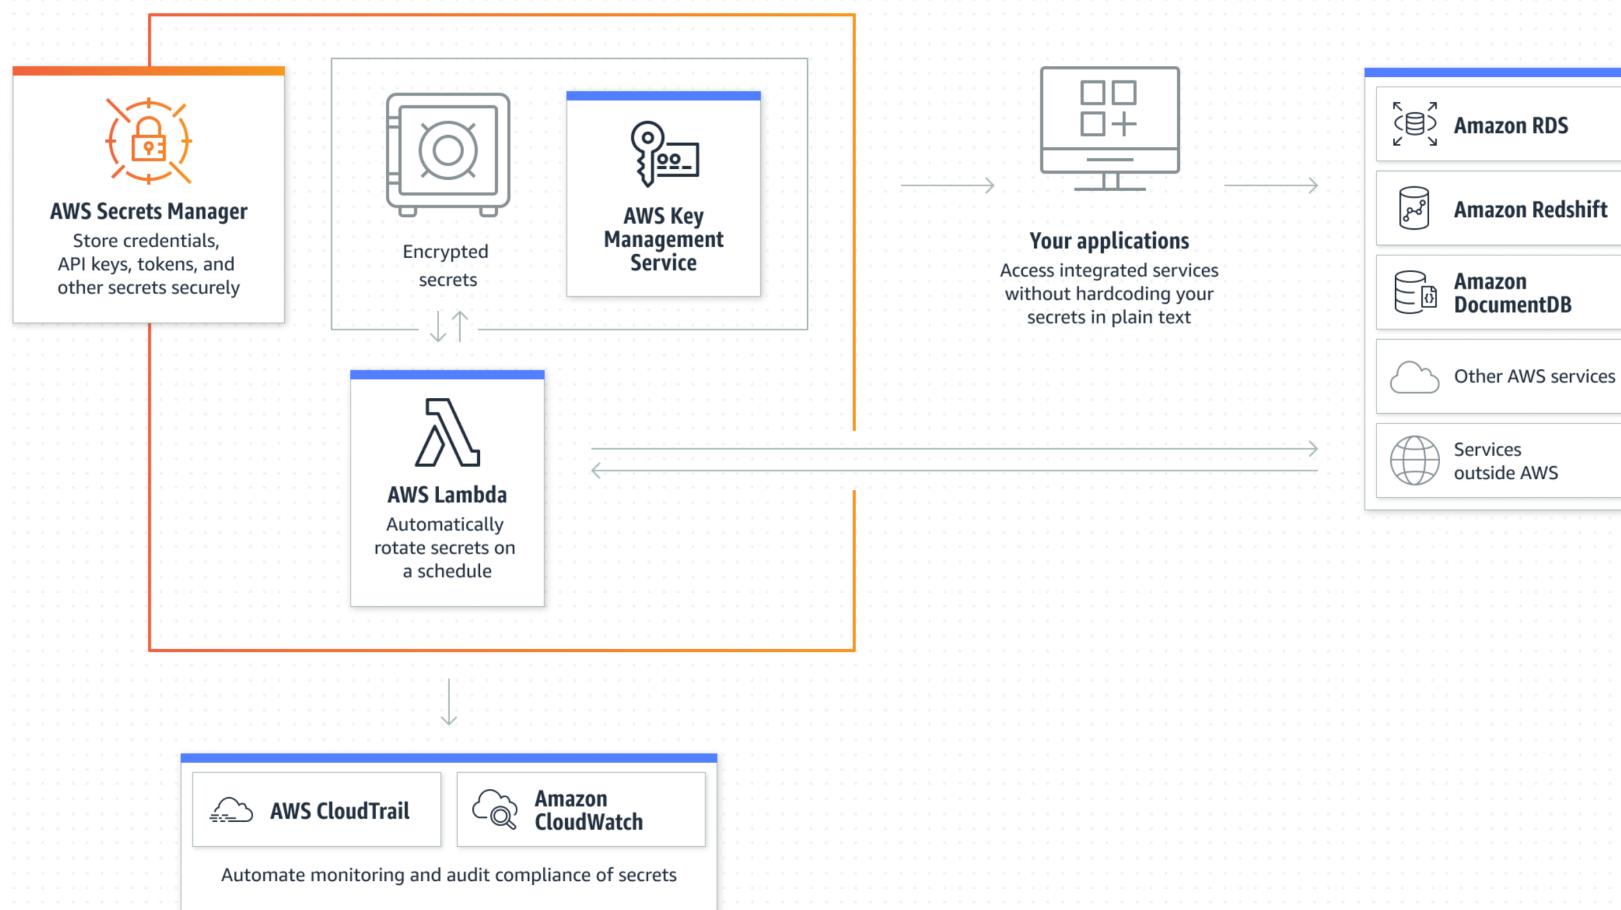

- It's not just humans who have identities; applications do too (API Keys).
- **The Mistake:** Developers hardcoding AWS Keys or API tokens directly into the source code (e.g., uploading them to GitHub).

## ■ The Solution:

- Use a **Secrets Manager** (e.g., AWS Secrets Manager, HashiCorp Vault).
- The app requests the key at runtime (when it starts), keeps it in memory, and never writes it to a file.

# Secrets Management – How Does It Work?

# Offboarding – The Most Dangerous Time

- **The "Zombie Account" Risk:** An employee leaves, but their account remains active. An attacker finds it 6 months later. What will happen?
- **The Golden Process:**
  1. **HR Trigger:** HR system notifies IT before the exit interview.
  2. **Revoke Access:** Kill SSO session, disable VPN, reset shared passwords.
  3. **Recover Assets:** Wipe mobile data, lock the laptop, retrieve physical keys.
  4. **Transfer Data:** Move their files to their manager (don't just delete them).

# End of the Lecture

Please do not hesitate to ask any questions to free your curiosity,

If you have any further questions after the class, please contact me via email ([charnon@cmkl.ac.th](mailto:charnon@cmkl.ac.th)).
